EXAMINER

SCHINDLER, DAVID M

ART UNIT

PAPER NUMBER

2862

MAIL DATE

DELIVERY MODE

02/12/2008

PAPER

Please find below and/or attached an Office communication concerning this application or proceeding.

The time period for reply, if any, is set in the attached communication.

Office Action Summary	Application No. 10/696,215	Applicant(s) GUALTIERI, DEVLIN M.	
	Examiner DAVID M. SCHINDLER	Art Unit 2862	

-- The MAILING DATE of this communication appears on the cover sheet with the correspondence address --

Period for Reply

A SHORTENED STATUTORY PERIOD FOR REPLY IS SET TO EXPIRE 3 MONTH(S) OR THIRTY (30) DAYS, WHICHEVER IS LONGER, FROM THE MAILING DATE OF THIS COMMUNICATION.

- Extensions of time may be available under the provisions of 37 CFR 1.136(a). In no event, however, may a reply be timely filed after SIX (6) MONTHS from the mailing date of this communication.
- If NO period for reply is specified above, the maximum statutory period will apply and will expire SIX (6) MONTHS from the mailing date of this communication.
- Failure to reply within the set or extended period for reply will, by statute, cause the application to become ABANDONED (35 U.S.C. § 133). Any reply received by the Office later than three months after the mailing date of this communication, even if timely filed, may reduce any earned patent term adjustment. See 37 CFR 1.704(b).

Status

- 1) ☒ Responsive to communication(s) filed on 30 October 2007.
- 2a) ☐ This action is **FINAL**. 2b) ☒ This action is non-final.
- 3) ☐ Since this application is in condition for allowance except for formal matters, prosecution as to the merits is closed in accordance with the practice under *Ex parte Quayle*, 1935 C.D. 11, 453 O.G. 213.

Disposition of Claims

- 4) ☒ Claim(s) 1,2,4,5,7,9-14,16,18-20 and 25 is/are pending in the application.
- 4a) Of the above claim(s) _____ is/are withdrawn from consideration.
- 5) ☐ Claim(s) _____ is/are allowed.
- 6) ☒ Claim(s) 1,2,4,5,7,9-14,16,18-20 and 25 is/are rejected.
- 7) ☐ Claim(s) _____ is/are objected to.
- 8) ☐ Claim(s) _____ are subject to restriction and/or election requirement.

Application Papers

- 9) ☐ The specification is objected to by the Examiner.
- 10) ☒ The drawing(s) filed on 28 October 2003 is/are: a) ☒ accepted or b) ☐ objected to by the Examiner.
Applicant may not request that any objection to the drawing(s) be held in abeyance. See 37 CFR 1.85(a).
Replacement drawing sheet(s) including the correction is required if the drawing(s) is objected to. See 37 CFR 1.121(d).
- 11) ☐ The oath or declaration is objected to by the Examiner. Note the attached Office Action or form PTO-152.

Priority under 35 U.S.C. § 119

- 12) ☐ Acknowledgment is made of a claim for foreign priority under 35 U.S.C. § 119(a)-(d) or (f).
- a) ☐ All b) ☐ Some * c) ☐ None of:
1. ☐ Certified copies of the priority documents have been received.
 2. ☐ Certified copies of the priority documents have been received in Application No. _____.
 3. ☐ Copies of the certified copies of the priority documents have been received in this National Stage application from the International Bureau (PCT Rule 17.2(a)).

* See the attached detailed Office action for a list of the certified copies not received.

DETAILED ACTION

1. This action is in response to the communication filed 10/30/2007.

Response to Arguments

2. Applicant's arguments with respect to the pending claims have been considered but are moot in view of the new ground(s) of rejection.

3. However, with regard to argument pertaining to the generation of an FM modulated signal (see the second full paragraph of page 2 of applicant's arguments), the Examiner respectfully disagrees. While the Examiner has turned to applicant's disclosure to illustrate the function of the resonant circuit of Ham et al. (herein Ham) (US 3,177,711), the Examiner notes that Ham explicitly discloses that so long as the vanes are either magnetic or conductive there will occur as the vanes pass the pickup a change of inductance of the winding (see column 3, lines 46-48). As noted by applicant, the resonant frequency of a parallel resonant LC tank circuit is $f = 1 / 2\pi * \text{squareroot}(LC)$ (see page 11, paragraph [0034] of applicant's specification). If the inductance changes as noted by Ham, then the resonant frequency of the circuit will change.

Claim Rejections - 35 USC § 103

4. The following is a quotation of 35 U.S.C. 103(a) which forms the basis for all obviousness rejections set forth in this Office action:

(a) A patent may not be obtained though the invention is not identically disclosed or described as set forth in section 102 of this title, if the differences between the subject matter sought to be patented and the prior art are such that the subject matter as a whole would have been obvious at the time the invention was made to a person having ordinary skill in the art to which said subject matter pertains. Patentability shall not be negated by the manner in which the invention was made.

5. The factual inquiries set forth in *Graham v. John Deere Co.*, 383 U.S. 1, 148 USPQ 459 (1966), that are applied for establishing a background for determining obviousness under 35 U.S.C. 103(a) are summarized as follows:

1. Determining the scope and contents of the prior art.
2. Ascertaining the differences between the prior art and the claims at issue.
3. Resolving the level of ordinary skill in the pertinent art.
4. Considering objective evidence present in the application indicating obviousness or nonobviousness.

6. Claims 1, 20, and 25 are rejected under 35 U.S.C. 103(a) as being unpatentable over Ham et al. (Ham) (3,177,711) in view of Miyata et al. (Miyata) (4,324,144).

7. As to Claims 1 and 25,

8. Ham discloses a sensor coil (20), an oscillator circuit including a capacitive circuit element (44) electrically coupled in parallel with the sensor coil to thereby form a parallel-

Art Unit: 2862

resonant LC tank circuit (Figure) having a resonant frequency that varies with the proximity of the sensor coil to each of the turbine blades (Column 3, Lines 36-58).

9. Ham does not explicitly disclose the oscillator circuit operable to generate and supply a sensor signal having a frequency that varies based on the resonant frequency of the parallel-resonant LC tank circuit , whereby the sensor signal is a frequency modulated sensor signal, and a frequency modulation (FM) demodulator adapted to receive the frequency modulated sensor signal and operable, in response thereto, to supply a proximity signal having an amplitude that varies with and is representative of, the proximity of each of the turbine blades to the non-rotating turbine component.

10. Miyata discloses the oscillator circuit (Figure 2) operable to generate and supply a sensor signal having a frequency that varies based on the resonant frequency of the parallel-resonant LC tank circuit (Column 3, Lines 33-60), whereby the sensor signal is a frequency modulated sensor signal, and a frequency modulation (FM) demodulator adapted to receive the frequency modulated sensor signal and operable, in response thereto, to supply a proximity signal having an amplitude that varies with and is representative of, the proximity of each of the turbine

Art Unit: 2862

blades to the non-rotating turbine component ((Column 3, Lines 33-60) and (Figures 1 and 2)).

11. It would have been obvious to a person of ordinary skill in the art at the time of invention to modify Ham to add the feature of the oscillator circuit operable to generate and supply a sensor signal having a frequency that varies based on the resonant frequency of the parallel-resonant LC tank circuit, whereby the sensor signal is a frequency modulated sensor signal, and a frequency modulation (FM) demodulator adapted to receive the frequency modulated sensor signal and operable, in response thereto, to supply a proximity signal having an amplitude that varies with and is representative of, the proximity of each of the turbine blades to the non-rotating turbine component as taught by Miyata in order to issue pulse voltage signals proportional to the number of the blades which have passed the detector (Column 3, Lines 61-65).

12. As to Claim 20,

13. Ham discloses a turbine case (Figure), a turbine wheel rotationally mounted within the turbine case (Figure), a plurality of turbine blades extending from the turbine wheel toward the turbine case (Figure), and a turbine blade proximity sensor system including a sensor coil (20) disposed at least partially within the turbine case,, an oscillator circuit

Art Unit: 2862

including a capacitive circuit element (44) electrically coupled in parallel with the sensor coil to thereby form a parallel-resonant LC tank circuit (Figure) having a resonant frequency that varies with the proximity of the sensor coil to each of the turbine blades (Column 3, Lines 36-58).

14. Ham does not explicitly disclose the oscillator circuit operable to generate and supply a sensor signal having a frequency that varies based on the resonant frequency of the parallel-resonant LC tank circuit, whereby the sensor signal is a frequency modulated sensor signal, and a frequency modulation (FM) demodulator coupled to receive the frequency modulated sensor signal and operable, in response thereto, to supply a proximity signal having an amplitude that varies with, and is representative of, the proximity of each of the turbine blades to the turbine case or one of the components mounted thereto.

15. Miyata discloses the oscillator circuit (Figure 2) operable to generate and supply a sensor signal having a frequency that varies based on the resonant frequency of the parallel-resonant LC tank circuit (Column 3, Lines 33-60), whereby the sensor signal is a frequency modulated sensor signal, and a frequency modulation (FM) demodulator coupled to receive the frequency modulated sensor signal and operable, in response thereto, to supply a proximity signal having an amplitude that varies with,

Art Unit: 2862

and is representative of, the proximity of each of the turbine blades to the turbine case or one of the components mounted thereto ((Figures 1 and 2) and (Column 3, Lines 33-60)).

16. It would have been obvious to a person of ordinary skill in the art at the time of invention to modify to add the feature of the oscillator circuit operable to generate and supply a sensor signal having a frequency that varies based on the resonant frequency of the parallel-resonant LC tank circuit, whereby the sensor signal is a frequency modulated sensor signal, and a frequency modulation (FM) demodulator coupled to receive the frequency modulated sensor signal and operable, in response thereto, to supply a proximity signal having an amplitude that varies with, and is representative of, the proximity of each of the turbine blades to the turbine case or one of the components mounted thereto as taught by Miyata in order to issue pulse voltage signals proportional to the number of the blades which have passed the detector (Column 3, Lines 61-65).

17. Claim 2 is rejected under 35 U.S.C. 103(a) as being unpatentable over Ham et al. (Ham) (3,177,711) in view of Miyata et al. (Miyata) (4,324,144) as applied to claim 1 and in further view of Oates et al. (Oates) (4,644,270).

18. As to Claim 2,

Art Unit: 2862

19. Ham in view of Miyata does not disclose a display coupled to receive the proximity signal from the FM demodulator and operable, in response thereto, to supply a visual display of the proximity of each of the turbine blades to the turbine shroud.

20. Oates discloses a display coupled to receive the proximity signal from a detector and operable, in response thereto, to supply a visual display of the proximity of each of the turbine blades to the turbine shroud ((Column 3, Lines 3-5) and (Column 11, Lines 19-32)).

21. It would have been obvious to a person of ordinary skill in the art to modify Ham in view of Miyata to include a display coupled to receive the proximity signal from the FM demodulator and operable, in response thereto, to supply a visual display of the proximity of each of the turbine blades to the turbine shroud given the above disclosure and teaching of Oates in order to allow for the monitoring of blading arrangements on turbines (Column 1, Lines 11-13).

22. Claim 4 is rejected under 35 U.S.C. 103(a) as being unpatentable over Ham et al. (Ham) (3,177,711) in view of Miyata et al. (Miyata) (4,324,144) as applied to claim 1 and in further view of Iida et al. (6,658,216).

23. As to Claim 4,

Art Unit: 2862

24. Ham in view of Miyata does not disclose the FM demodulator includes a ratio detector.

25. Iida et al. discloses the FM demodulator includes a ratio detector (Column 6, Lines 33-37).

26. It would have been obvious to a person of ordinary skill in the art to modify Ham in view of Miyata to include the FM demodulator includes a ratio detector as taught by Iida et al. in order to advantageously utilize a readily known component for the purpose of signal demodulation.

27. Claim 5 is rejected under 35 U.S.C. 103(a) as being unpatentable over Ham et al. (Ham) (3,177,711) in view of Miyata et al. (Miyata) (4,324,144) as applied to claim 1 and in further view of Arms et al. (5,497,147).

28. As to Claim 5,

29. Ham in view of Miyata does not disclose the oscillator circuit is configured to wirelessly transmit the sensor signal; and the FM demodulator circuit is configured to wirelessly receive the transmitted sensor signal.

30. Arms et al. discloses the oscillator circuit is configured to wirelessly transmit the sensor signal; and the FM detector circuit is configured to wirelessly receive the transmitted sensor signal ((Figures 4 and 5) and (Column 2, Lines 33-51)).

Art Unit: 2862

31. It would have been obvious to a person of ordinary skill in the art to modify Ham in view of Miyata to include the oscillator circuit is configured to wirelessly transmit the sensor signal; and the FM demodulator circuit is configured to wirelessly receive the transmitted sensor signal given the above disclosure and teaching of Arms et al. in order to advantageously allow for remote data processing.

32. Claim 7 is rejected under 35 U.S.C. 103(a) as being unpatentable over Ham et al. (Ham) (3,177,711) in view of Miyata et al. (Miyata) (4,324,144) as applied to claim 1 and in further view of Barclay et al. (Barclay) (5,854,553).

33. As to Claim 7,

34. Ham in view of Miyata does not disclose a coaxial cable coupled between the sensor coil and the oscillator circuit, the coaxial cable having a capacitance that acts as at least one of the capacitance circuit elements.

35. Barclay discloses a coaxial cable coupled between the sensor coil and the oscillator circuit, the coaxial cable having a capacitance that acts as at least one of the capacitance circuit elements ((Figures 1b and 2) and (Column 5, Lines 13-30)).

36. It would have been obvious to a person of ordinary skill in

Art Unit: 2862

the art to modify Ham in view of Miyata to include a coaxial cable coupled between the sensor coil and the oscillator circuit, the coaxial cable having a capacitance that acts as at least one of the capacitance circuit elements as taught by Barclay in order to reduce the number of components necessary to form a desired resonant circuit (note Column 5, Lines 26-41).

37. Claim 9 is rejected under 35 U.S.C. 103(a) as being unpatentable over Ham et al. (Ham) (3,177,711) in view of Miyata et al. (Miyata) (4,324,144) as applied to claim 1 and in further view of Wilkinson (GB 2167603 A).

38. As to Claim 9,

39. Ham in view of Miyata does not disclose a ceramic core, and a conductor selected from a group consisting of platinum and molybdenum.

40. Wilkinson discloses a ceramic core and a conductor consisting of platinum (Page 1, Left Column, Lines 51-54).

41. It would have been obvious to a person of ordinary skill in the art to modify Ham in view of Miyata to include a ceramic core and a conductor consisting of platinum as taught by Wilkinson in order to have a sensor that gives a fast and accurate response and can withstand corrosive environments (Page 1, Left Column, Lines 29-33).

42. Claim 10 is rejected under 35 U.S.C. 103(a) as being unpatentable over Ham et al. (Ham) (3,177,711) in view of Miyata et al. (Miyata) (4,324,144) as applied to claim 1 and in further view of Schroeder (6,486,657).

43. As to Claim 10,

44. Ham in view of Miyata does not disclose a peak detector coupled to receive the proximity signal and operable, in response thereto, to determine a peak value of the proximity signal.

45. Schroeder discloses a peak detector (30) coupled to receive the proximity signal and operable, in response thereto, to determine a peak value of the proximity signal ((Column 4, Lines 55-67) and (Column 5, Lines 1-15)).

46. It would have been obvious to a person of ordinary skill to modify Ham in view of Miyata to include a peak detector coupled to receive the proximity signal and operable, in response thereto, to determine a peak value of the proximity signal as taught by Schroeder in order to provide a failure circuit that provides for the recognition of failure modes (Column 5, Lines 7-11).

Art Unit: 2862

47. Claims 11 and 12 are rejected under 35 U.S.C. 103(a) as being unpatentable over Ham et al. (Ham) (3,177,711) in view of Miyata et al. (Miyata) (4,324,144) and Stowell (4,842,477).

48. As to Claim 11,

49. Ham discloses a sensor coil (20), an oscillator circuit including a capacitive circuit element (44) electrically coupled in parallel with the sensor coil to thereby form a parallel-resonant LC tank circuit (Figure) having a resonant frequency that varies with the proximity of the sensor coil to each of the turbine blades (Column 3, Lines 36-58).

50. Ham does not explicitly disclose the oscillator circuit operable to generate and supply a sensor signal having a frequency that varies based on the resonant frequency of the parallel-resonant LC tank circuit, whereby the sensor signal is a frequency modulated sensor signal, and a frequency modulation (FM) demodulator adapted to receive the frequency modulated sensor signal and operable, in response thereto, to supply a proximity signal having an amplitude that varies with, and is representative of, the proximity of each of the turbine blades to the non-rotating turbine component, and a controller coupled to receive the proximity signal from the FM detector and operable, in response thereto, to control the proximity of the turbine blades to the non-rotating turbine component.

Art Unit: 2862

51. Miyata discloses the oscillator circuit (Figure 2) operable to generate and supply a sensor signal having a frequency that varies based on the resonant frequency of the parallel-resonant LC tank circuit (Column 3, Lines 33-60), whereby the sensor signal is a frequency modulated sensor signal, and a frequency modulation (FM) demodulator adapted to receive the frequency modulated sensor signal and operable, in response thereto, to supply a proximity signal having an amplitude that varies with, and is representative of, the proximity of each of the turbine blades to the non-rotating turbine component ((Figures 1 and 2) and (Column 3, Lines 33-60)).

52. It would have been obvious to a person of ordinary skill in the art at the time of invention to modify to add the feature of the oscillator circuit operable to generate and supply a sensor signal having a frequency that varies based on the resonant frequency of the parallel-resonant LC tank circuit, whereby the sensor signal is a frequency modulated sensor signal, and a frequency modulation (FM) demodulator adapted to receive the frequency modulated sensor signal and operable, in response thereto, to supply a proximity signal having an amplitude that varies with, and is representative of, the proximity of each of the turbine blades to the non-rotating turbine component as taught by Miyata in order to issue pulse voltage signals

Art Unit: 2862

proportional to the number of the blades which have passed the detector (Column 3, Lines 61-65).

53. Stowell discloses controlling the proximity of the turbine blades to the non-rotating turbine component (Abstract, Lines 10-15).

54. It would have been obvious to a person of ordinary skill in the art to modify Ham in view of Miyata to include a controller to control the proximity of the turbine blades to the non-rotating turbine component given the above disclosure and the teaching of Stowell in order to prevent turbine malfunction by preventing blade damage.

55. As to Claim 12,

56. Ham discloses the non-rotating component is either a turbine case or a component coupled to the turbine shroud (Figure).

57. Ham does not disclose the controller controls the proximity of the turbine blades to the non-rotating turbine component by controlling turbine shroud temperature.

58. Stowell discloses controlling the proximity of the turbine blades to the non-rotating component by controlling turbine shroud temperature (Abstract, Lines 10-15).

59. It would have been obvious to a person of ordinary skill in the art to modify Ham to include the non-rotating component is

Art Unit: 2862

either a turbine case or a component coupled to the turbine shroud, and the controller controls the proximity of the turbine blades to the non-rotating turbine component by controlling turbine shroud temperature given the above disclosure and teaching of Stowell in order to prevent turbine malfunction by preventing blade damage.

60. Claim 13 is rejected under 35 U.S.C. 103(a) as being unpatentable over Ham et al. (Ham) (3,177,711) in view of Miyata et al. (Miyata) (4,324,144) and Stowell (4,842,477) as applied to claim 12 and in further view of Davison (4,230,436).

61. Ham in view of Miyata and Stowell does not disclose the controller, in response to the proximity signal, supplies one or more valve control signals, and wherein the system includes one or more valves in fluid communication between a cooling air source and the turbine shroud, each valve having an actuator coupled to receive one or more of the valve control signals and operable, in response thereto, to selectively move its associated valve between an open position and a closed position, to thereby selectively cool the turbine case.

62. Davison discloses one valve in fluid communication between a cooling air source, the valve having an actuator that selectively moves the valve between an open position and a

Art Unit: 2862

closed position, to thereby selectively maintain optimum rotor-to-shroud clearances ((Figures 1 and 8A-8C) and (Column 6, Lines 28-33) and (Column 8, 24-30) and (Abstract, Lines 4-11)).

63. It would have been obvious to a person of ordinary skill in the art to modify Ham in view of Miyata and Stowell to include the controller, in response to the proximity signal, supplies one or more valve control signals, and wherein the system includes one or more valves in fluid communication between a cooling air source and the turbine shroud, each valve having an actuator coupled to receive one or more of the valve control signals and operable, in response thereto, to selectively move its associated valve between an open position and a closed position, to thereby selectively cool the turbine case given the above disclosure and teaching of Davison in order to prevent turbine malfunction by preventing blade damage.

64. Claim 14 is rejected under 35 U.S.C. 103(a) as being unpatentable over Ham et al. (Ham) (3,177,711) in view of Miyata et al. (Miyata) (4,324,144) and Stowell (4,842,477) as applied to claim 11 and in further view of Oates et al. (Oates) (4,644,270).

65. Ham in view of Miyata and Stowell do not disclose a display coupled to receive the proximity signal from the FM demodulator

Art Unit: 2862

and operable, in response thereto, to supply a visual display of the proximity of each of the turbine blades to the turbine shroud.

66. Oates discloses a display coupled to receive the proximity signal from a detector and operable, in response thereto, to supply a visual display of the proximity of each of the turbine blades to the turbine shroud (Column 11, Lines 19-32).

67. It would have been obvious to a person of ordinary skill in the art to modify Ham in view of Miyata and Stowell to include a display coupled to receive the proximity signal from the FM demodulator and operable, in response thereto, to supply a visual display of the proximity of each of the turbine blades to the turbine shroud given the above disclosure and teaching of Oates in order to allow for the monitoring of blading arrangements on turbines (Column 1, Lines 11-13).

68. Claim 16 is rejected under 35 U.S.C. 103(a) as being unpatentable over Ham et al. (Ham) (3,177,711) in view of Miyata et al. (Miyata) (4,324,144) and Stowell (4,842,477) as applied to claim 11 and in further view of Barclay et al. (Barclay) (5,854,553).

69. Ham in view of Miyata and Stowell does not disclose a coaxial cable coupled between the sensor coil and the oscillator

Art Unit: 2862

circuit, the coaxial cable having a capacitance that acts as at least one of the capacitance circuit elements.

70. Barclay discloses a coaxial cable coupled between the sensor coil and the oscillator circuit, the coaxial cable having a capacitance that acts as at least one of the capacitance circuit elements ((Figures 1b and 2) and (Column 5, Lines 13-30)).

71. It would have been obvious to a person of ordinary skill in the art to modify Ham in view of Miyata and Stowell to include a coaxial cable coupled between the sensor coil and the oscillator circuit, the coaxial cable having a capacitance that acts as at least one of the capacitance circuit elements as taught by Barclay in order to reduce the number of components necessary to form a desired resonant circuit (note Column 5, Lines 26-41).

72. Claim 18 is rejected under 35 U.S.C. 103(a) as being unpatentable over Ham et al. (Ham) (3,177,711) in view of Miyata et al. (Miyata) (4,324,144) and Stowell (4,842,477) as applied to claim 11 and in further view of Wilkinson (GB 2167603 A).

73. Ham in view of Miyata and Stowell does not disclose a ceramic core, and a conductor selected from a group consisting of platinum and molybdenum.

74. Wilkinson discloses a ceramic core and a conductor

Art Unit: 2862

consisting of platinum (Page 1, Left Column, Lines 51-54).

75. It would have been obvious to a person of ordinary skill in the art to modify Ham in view of Miyata and Stowell to include a ceramic core and a conductor consisting of platinum as taught by Wilkinson in order to have a sensor that gives a fast and accurate response and can withstand corrosive environments (Page 1, Left Column, Lines 29-33).

76. Claim 19 is rejected under 35 U.S.C. 103(a) as being unpatentable over Ham et al. (Ham) (3,177,711) in view of Miyata et al. (Miyata) (4,324,144) and Stowell (4,842,477) as applied to claim 11 and in further view of Schroeder (6,486,657).

77. Ham in view of Miyata and Stowell do not disclose a peak detector coupled to receive the proximity signal and operable, in response thereto, to determine a peak value of the proximity signal.

78. Schroeder discloses a peak detector (30) coupled to receive the proximity signal and operable, in response thereto, to determine a peak value of the proximity signal ((Column 4, Lines 55-67) and (Column 5, Lines 1-15)).

79. It would have been obvious to a person of ordinary skill to modify Ham in view of Miyata and Stowell to include a peak detector coupled to receive the proximity signal and operable,

Art Unit: 2862

in response thereto, to determine a peak value of the proximity signal as taught by Schroeder in order to provide a failure circuit that provides for the recognition of failure modes (Column 5, Lines 7-11).

Conclusion

80. Any inquiry concerning this communication or earlier communications from the examiner should be directed to DAVID M. SCHINDLER whose telephone number is (571)272-2112. The examiner can normally be reached on Monday-Friday (8:00AM-5:00PM).

81. If attempts to reach the examiner by telephone are unsuccessful, the examiner's supervisor, Patrick Assouad can be reached on (571) 272-2210. The fax phone number for the organization where this application or proceeding is assigned is 571-273-8300.
